ID	Reset Name
Async	BusReset: Asynchronous Bus Reset

1.1.1. Interrupt Collector Block (InterruptCollectorBlk)

This block defines a basic interrupt collector for **level triggered** interrupt sources. Usually edge triggered sources e.g., timer pulses can be converted to level triggered ones by catching them in the user logic.

Constraints:

1. Allow interrupt processing by multiple CPUs without need for spinlocks.
2. Enable forwarding an interrupt to the CPU(s) by a mask for each source.
3. Provide control pulses to notify the user logic when a interrupt service for an interrupt request has been started and has been ended.
4. Use the control pulses to reset the interrupt request fo a source or do it by a write or read access directly to the user logic e.g. reading the receive data register of an UART.

Interrupt Collector details:
